

Roof Trusses Completed

The main roof trusses were too large to transport in one piece, so they are flat on top (two photos at top).

The very top pieces are added after the main trusses have been placed and plywood sheathing is in place to stabilize the trusses and provide a working platform. The top triangular piece of truss is "piggybacked" onto the main truss.

Bottom photos show the trusses at start of plywood, from inside and outside.
